

NGUYEN DANG QUY

Backend Engineer

Ho Chi Minh City, Vietnam | (+84) 869 960 852 | dangquyitt@gmail.com | [Portfolio](#)

EDUCATION

University of Transport and Communications - Ho Chi Minh City Campus

2021 - 2025

Bachelor of Information Technology | GPA: 3.3/4.0

Ho Chi Minh City, Vietnam

TECHNICAL SKILLS

Golang: Concurrent programming, goroutines, channels, context, unit testing, Testify, Mockery

Real-Time & Networking: Low-latency systems, RTP, SIPREC, WebSocket, network traffic capture, protocol parsing, real-time streaming, PCM audio processing

Backend: RESTful APIs, gRPC, GraphQL, Echo

Data & Messaging: PostgreSQL, Redis, RabbitMQ, NATS

Distributed Systems: High availability, distributed locking, concurrency control, asynchronous processing

AWS: Lambda, S3, Kinesis

Infrastructure & Observability: Docker, Docker Compose, Kubernetes, Linux, Helm, ArgoCD, Prometheus, Grafana, Loki

AI-Assisted Engineering: Claude Code, Cursor, MCP, agentic workflows

WORK EXPERIENCE

Nami Technology

Apr. 2025 - Present

Golang Backend Developer

Ho Chi Minh City, Vietnam

- Developed distributed, low-latency real-time media systems in Golang for workloads designed to support 2,000+ concurrent calls across heterogeneous contact-center environments.
- Built low-level network processing components to capture live traffic, parse RTP and SIPREC streams, extract encoded audio payloads, and convert media into PCM for real-time downstream processing.
- Developed a one-to-many real-time media pipeline that fans out continuous PCM streams to independent consumers including speech recognition, voice biometrics, agent scoring, and AI/LLM services.
- Designed pluggable ingestion and transport components across RTP capture, SIPREC, PBX audio hooks, WebSocket, and AWS Kinesis; engineered long-running Go streams with goroutines, channels, bounded buffering, timeout and retry strategies, reconnection, and graceful shutdown.
- Designed and operated highly available active-standby deployments using distributed locking and concurrency control, including production deployments for VietinBank and TPBank in Vietnam and customer environments in Japan and Thailand.
- Took end-to-end ownership of real-time middleware components from technical design and implementation through testing, deployment, observability, production troubleshooting, and continuous improvement.

Allexceed

Nov. 2024 - Mar. 2025

Java Backend Developer

Ho Chi Minh City, Vietnam

- Maintained and extended a large-scale TV station management system built on a 30+ year legacy codebase, working within established enterprise architecture and customer-defined engineering standards.
- Analyzed unfamiliar legacy source code and adapted to the Java technology stack to implement new functionality and resolve production issues using Spring Boot, Spring Security, JavaFX, and Oracle.
- Collaborated with Japanese stakeholders and engineers to clarify requirements, understand existing system behavior, and deliver customer-requested changes in an international outsourcing environment.

DW Technology

Jun. 2023 - Oct. 2024

Golang Backend Developer

Ho Chi Minh City, Vietnam

- Served as a primary Golang backend developer for CRM and affiliate marketing products, taking backend features from requirement analysis and data modeling through API implementation, testing, and production delivery.
- Designed and developed RESTful and GraphQL APIs in Go using Echo, separating transport, business logic, and data-access responsibilities to keep backend modules maintainable and testable.
- Designed relational data models with PostgreSQL and GORM, using Redis for caching and RabbitMQ for asynchronous processing across customer, lead, campaign, affiliate, and revenue-related workflows.
- Integrated third-party systems including ACB Bank and OnePay for payment and subscription workflows, including failure handling around external services.
- Built unit tests using Testify and Mockery, maintained Docker-based environments, and collaborated with product and frontend teams to deliver production-ready backend features.

PROJECTS

Shadowify

Mar. 2025 - Jul. 2025

AI-powered English learning platform

GitHub: github.com/dangquyitt/shadowify-mobile

- Designed and developed backend APIs in Golang using Echo for web and mobile clients, integrating speech and AI processing services.
- Built media-processing workflows for YouTube ingestion, transcription, pronunciation evaluation, and AI-based CEFR classification from A1 to C2 using Whisper.
